

Resolving galaxy evolution across cosmic time

Extragalactic Astrophysics Group

Cavendish Laboratory (Department of Physics)
Kavli Institute for Cosmology, Cambridge (KICC)

Extragalactic Astrophysics Group

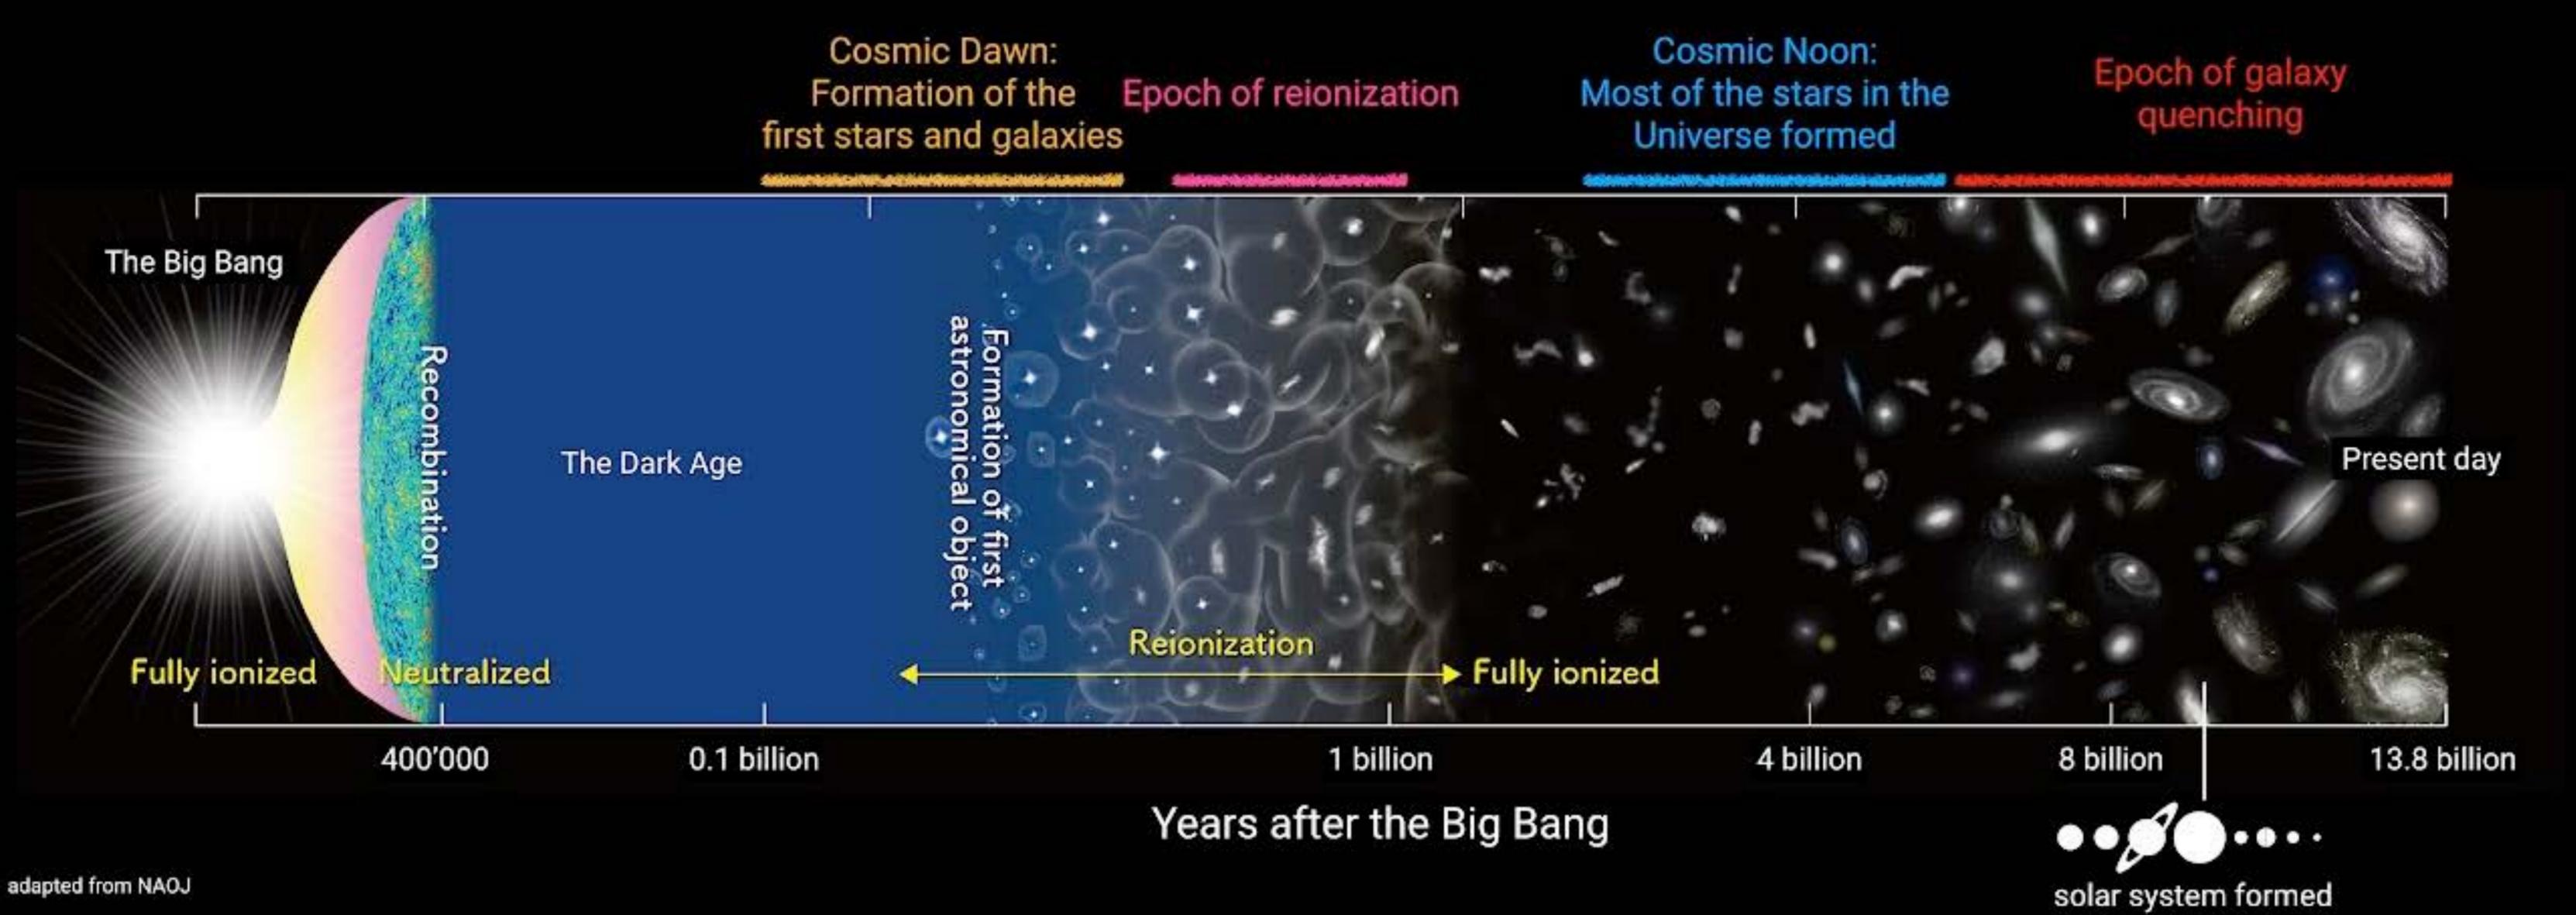

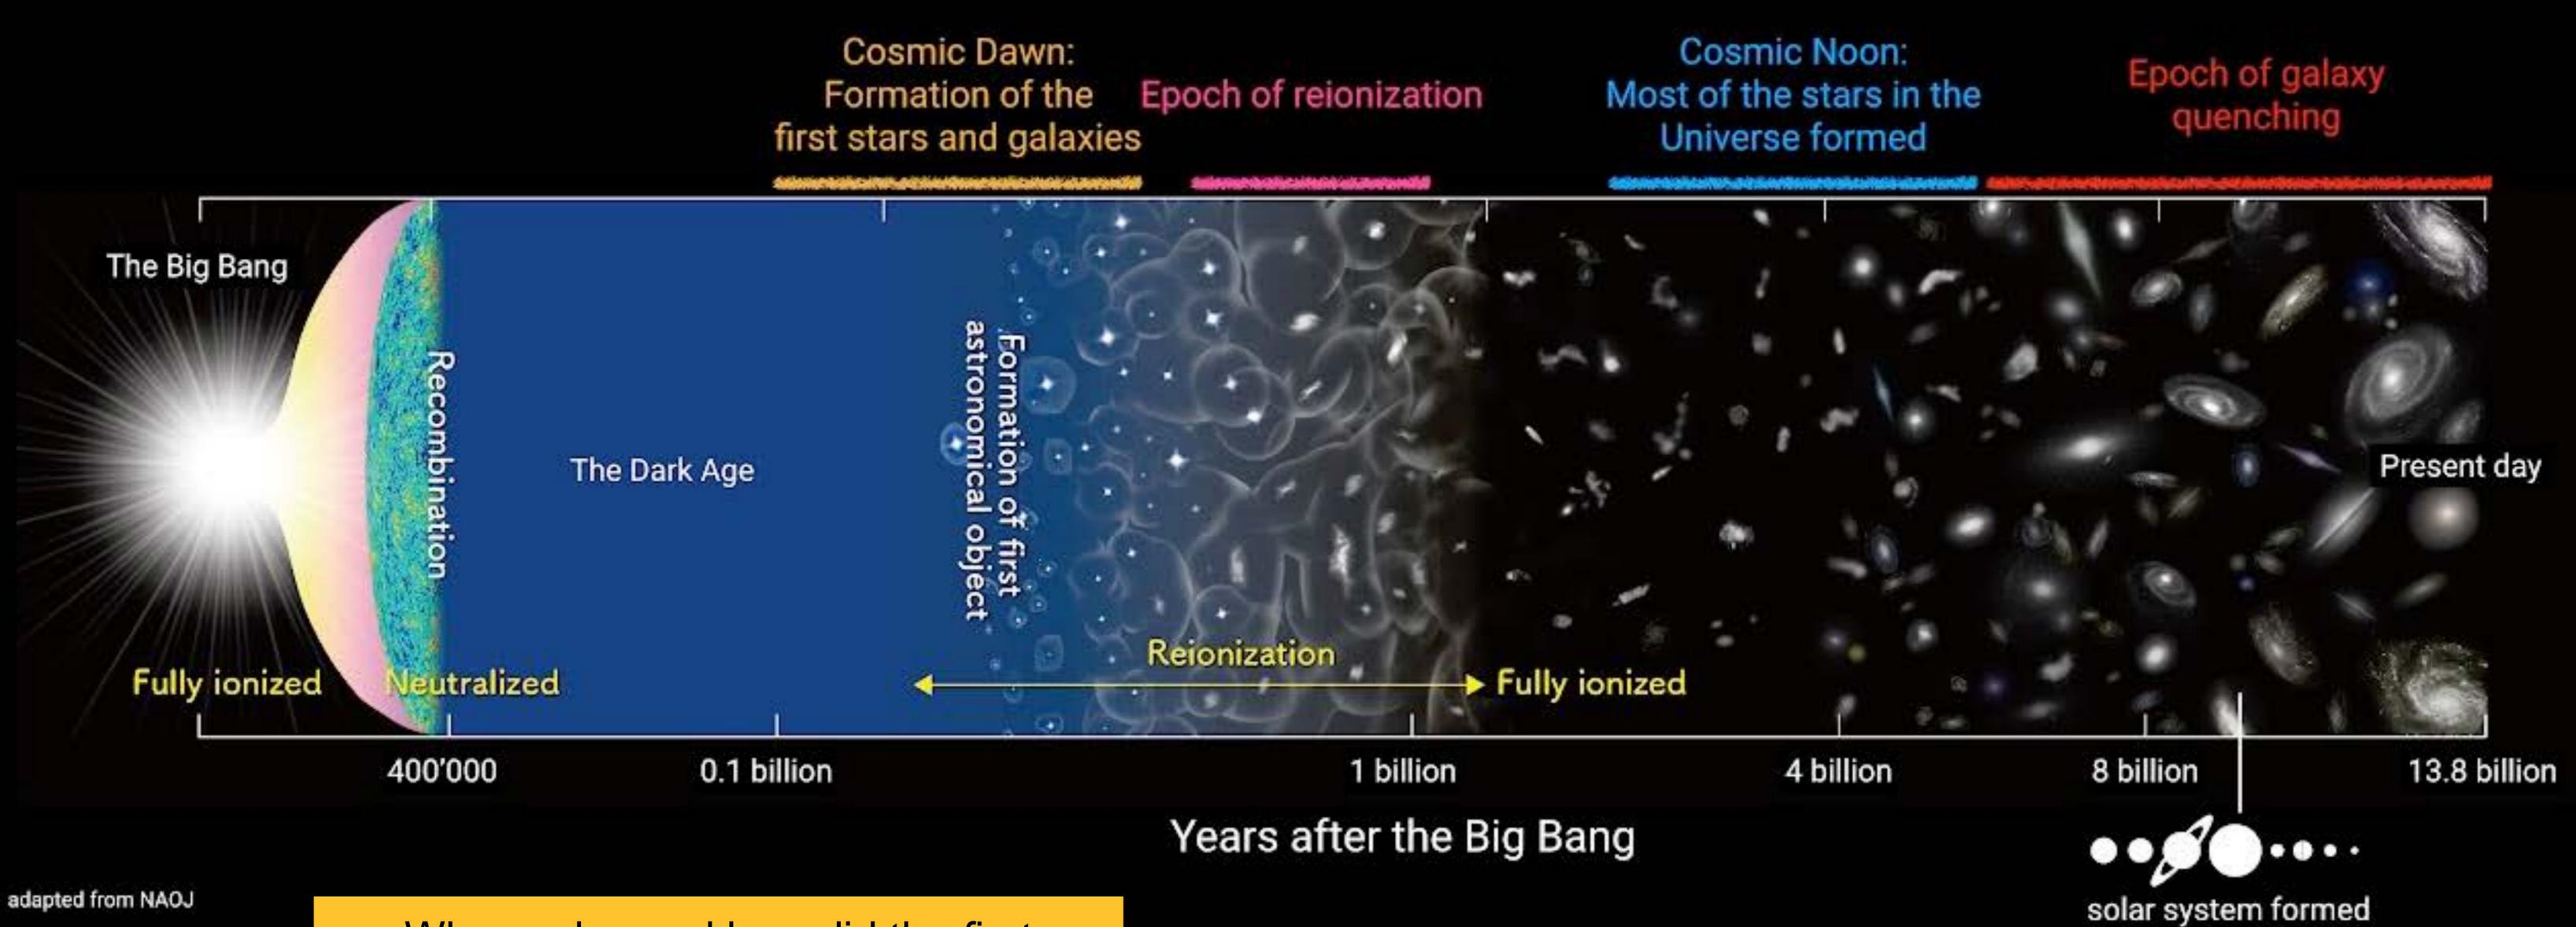

Team Co-Lead: Prof Roberto Maiolino & Dr Sandro Tacchella

Postdocs: Dr Francesco D'Eugenio, Dr Mirko Curti (→ ESO Fellow), Dr Nicolas Laporte (Kavli Senior Fellow), Dr Joanna (Asia) Piotrowska, Dr Jan Scholtz, Dr Charlotte Simmonds, Dr Hannah Übler (Newton Kavli Fellow), Dr Joris Witstok

Students: William Baker, Lola Danhaive, Tobias Looser, Gabriel Maheson, William McClymont, Dily Ong, David Puskas, Lester Sandles, Jenny Wan, Callum Witten

...and greatly supported by Steve & Alison!

adapted from NAOJ

When, why, and how did the first galaxies form and the Dark Ages end?

How do galaxies chemically enrich?

How do galaxies regulate and quench star formation? Formation of the first quiescent galaxies?

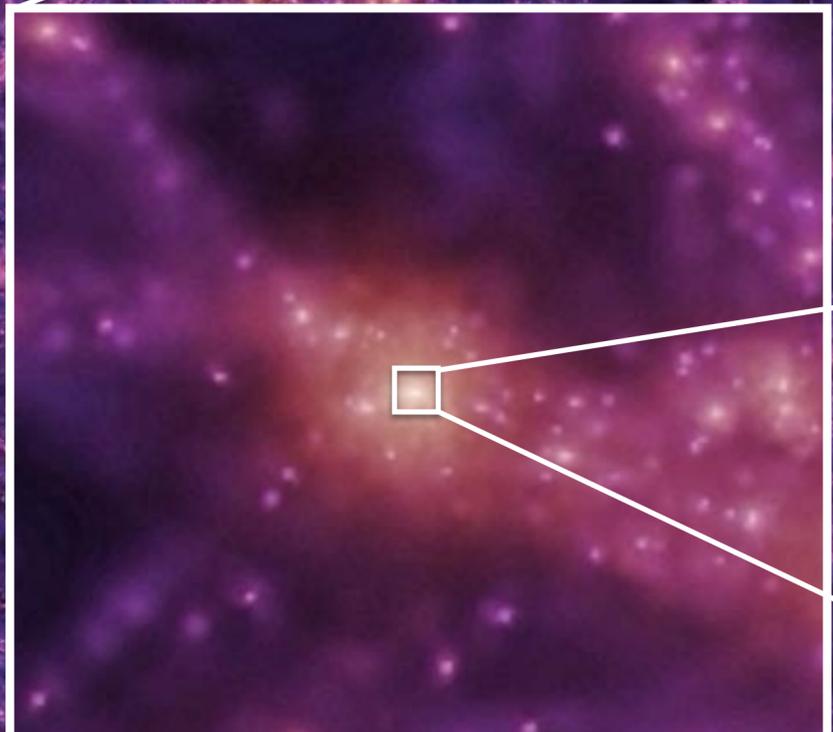

Which sources reionize the Universe?

What are the stellar populations of the first galaxies? PopIII? BH?

When and how do galaxies form their bulge and disk components?

cosmic web (~Gpc)

125 Mpc/h

dark matter halos (~Mpc)

galaxies (~kpc)

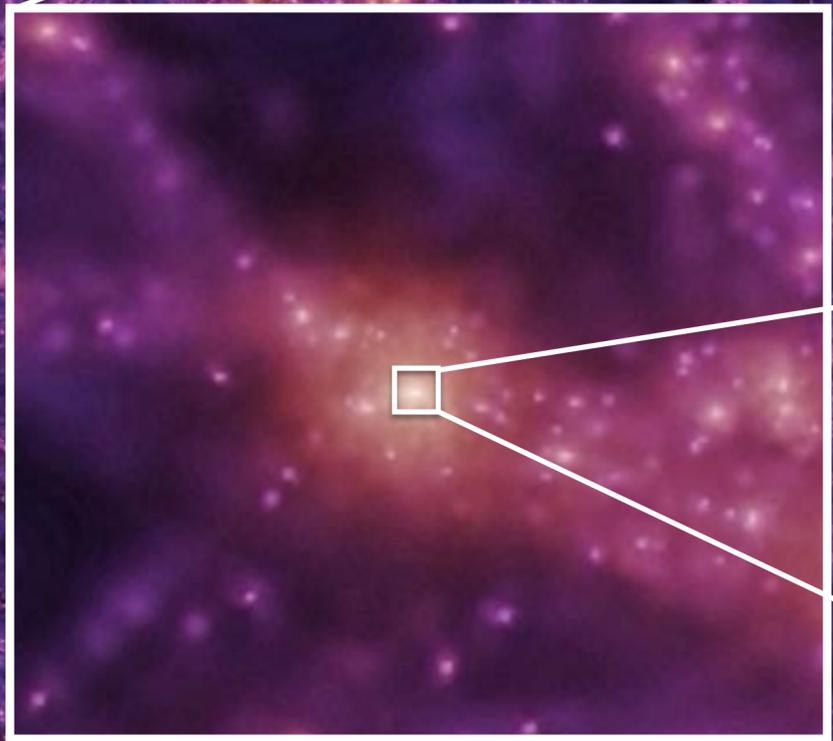

1 pc = 3 ly = 3×10^{16} m

cosmic web (~Gpc)

Extremely Large Telescope (ELT)

JADES GOODS-S

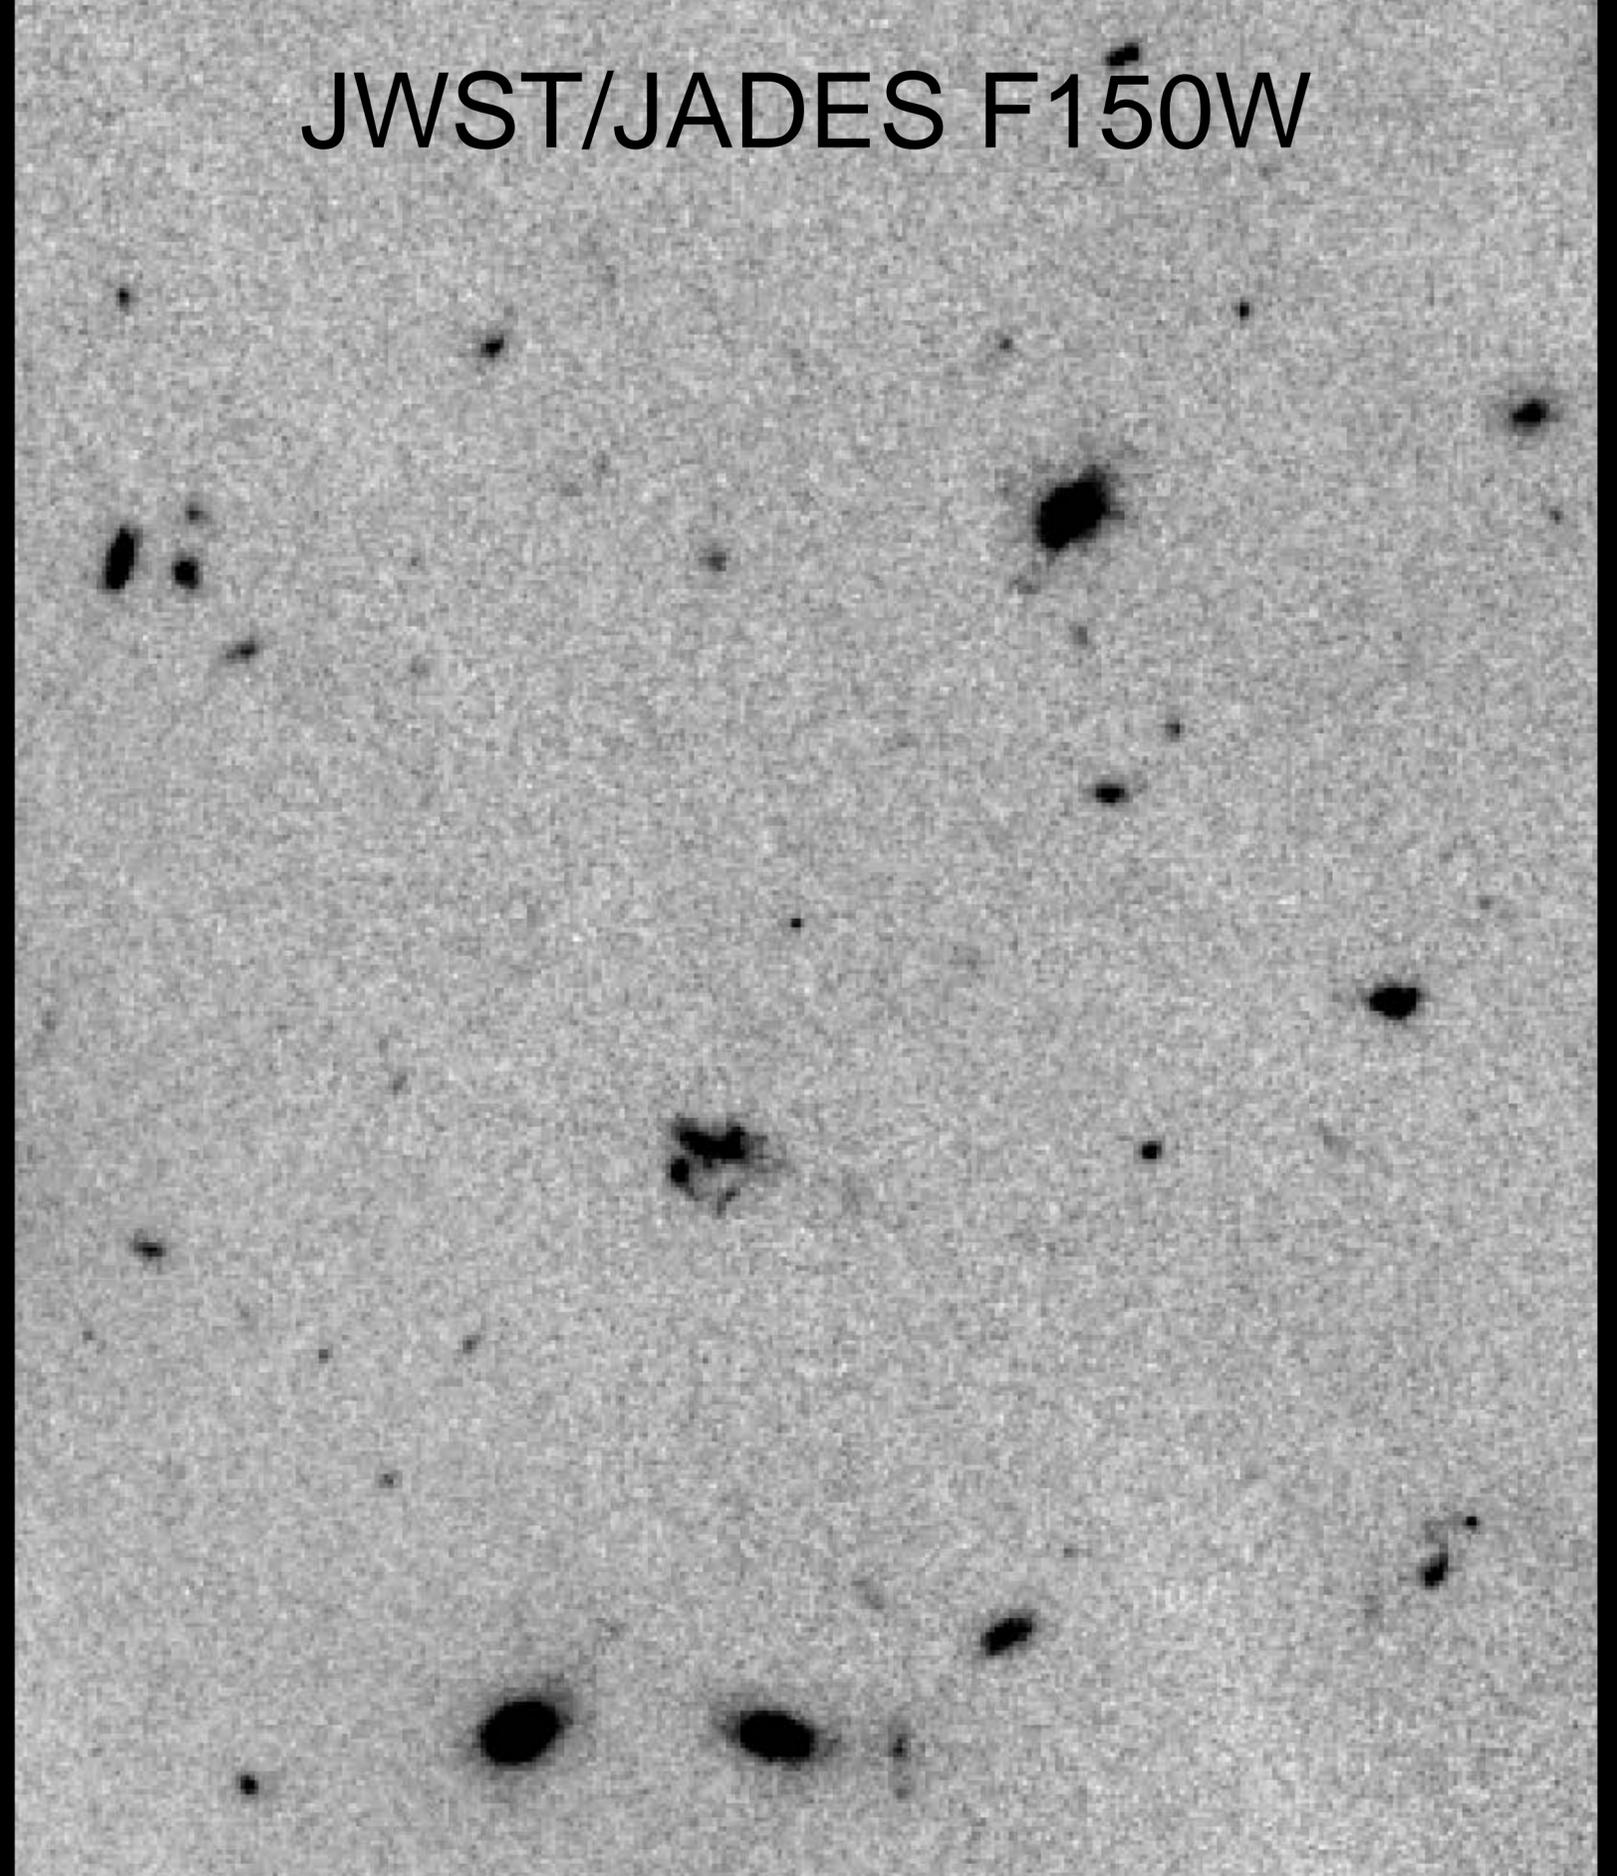

About 100,000 galaxies, in 9-14 JWST filters, reaching AB=29.
We planned for ~650 hrs in GOODS-S, but only 40% was
scheduled in Year 1.

Unprecedented discovery space with MOONS

- MOONS: exceptional combination of large multiplexing, high sensitivity, broad spectral coverage, large area and high fiber density
- **Cambridge** is part of the MOONS consortium
- MOONRISE: SDSS-like survey around Cosmic Noon (redshift $z \sim 1-2.5$)

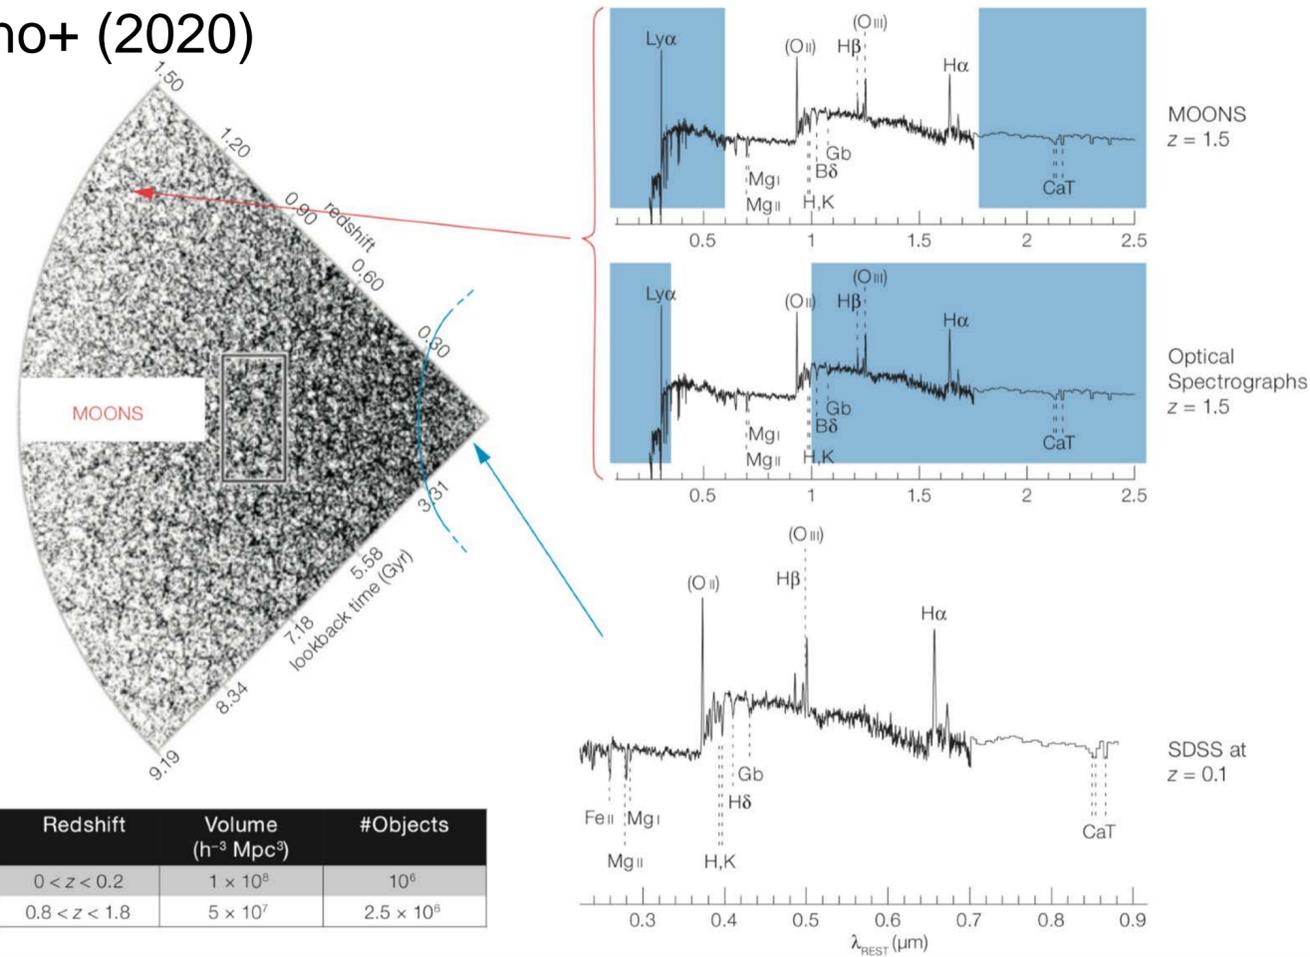

Unprecedented discovery space with MOONS

- MOONS: exceptional combination of large multiplexing, high sensitivity, broad spectral coverage, large area and high fiber density
- **Cambridge** is part of the MOONS consortium
- MOONRISE: SDSS-like survey around Cosmic Noon (redshift $z \sim 1-2.5$)

Maiolino+ (2020)

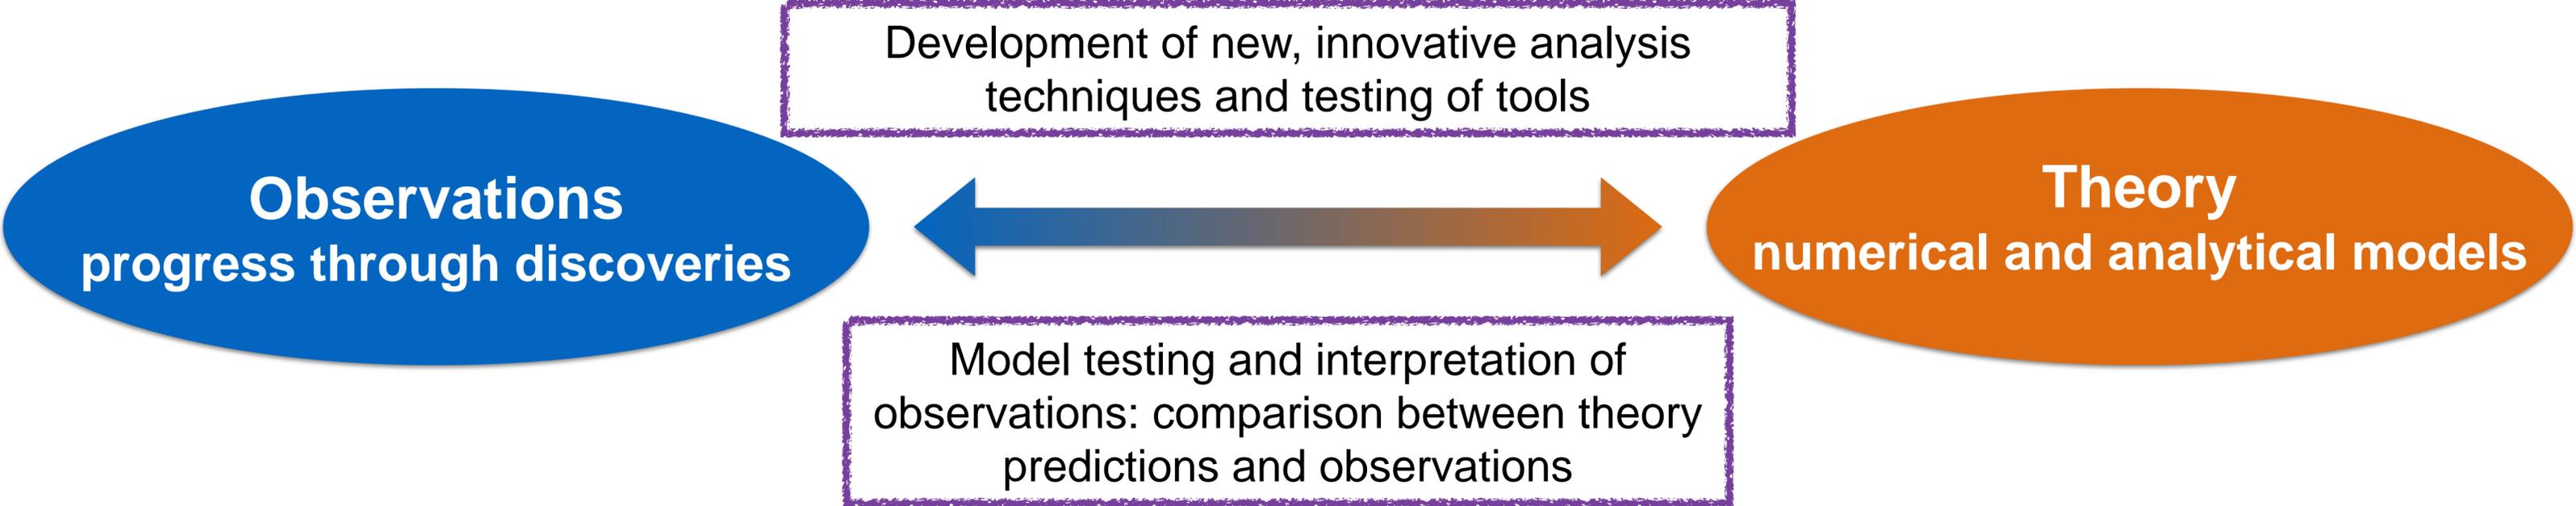

Survey	Redshift	Volume ($h^{-3} \text{ Mpc}^3$)	#Objects
SDSS	$0 < z < 0.2$	1×10^6	10^6
MOONS	$0.8 < z < 1.8$	5×10^7	2.5×10^6

Our key focus:

- Star-formation variability: what regulates star formation?
- Chemical abundances and star-formation histories
- Which role do black holes play in shutting down star formation?
- How does the environment affect the evolution of galaxies?
